

Freelance Client Onboarding & Proposal Agent

5–7 Minute Stakeholder Presentation

Slide 1 Business Problem

- Freelancers spend significant time reviewing client requests.
- Requirements must be matched with available services.
- Budget and deadline feasibility must be checked.
- Proposals then have to be written manually.
- Manual work slows client response time.

Key message:

We built an AI-assisted system to automate the repetitive parts while keeping humans in control.

Slide 2 Proposed Solution

- Three specialized AI agents.
- Verified service information.
- Human approval before final output.

Key message:

This is an agent workflow, not simply a chatbot answering questions.

Slide 3 Why CrewAI?

- The problem naturally contains three distinct roles.
- Research, scope analysis, and proposal writing can be separated.
- CrewAI makes role-based collaboration straightforward.
- Context can be passed between tasks.
- LangGraph was not necessary because the workflow does not require complex branching or persistent graph state.

Key message:

We selected the simplest framework that matched the problem.

Slide 4 How the System Works

Research Agent

- Identifies the relevant service.
- Extracts client requirements.
- Finds missing information.

Scope Analyst

- Checks verified price.
- Checks budget.
- Checks delivery time.
- Checks deadline.

Proposal Writer

- Creates the final proposal.
- Uses verified information.
- Avoids unsupported claims through grounding rules.

Additional components:

- Pydantic validation
 - services.csv
 - FastAPI
 - Logging
 - Error handling
 - Human approval
-

Slide 5 Evaluation Results

8 test cases were evaluated.

Criterion	Result
Task Success	8/8
Factual Accuracy	8/8
Requirement Accuracy	6/8
Proposal Quality	8/8
Safety / Grounding	0/8 fully grounded

Testing included:

- Normal cases
- Missing budget/deadline

- Adversarial request

Key finding:

The system was good at identifying services, prices, and timelines but frequently expanded the scope with unsupported features.

Slide 6 Limitations & Guardrails

Main limitation

LLMs tend to add common industry features when writing professional proposals.

Examples:

- SEO
- Responsive design
- Admin panels
- Deployment
- Databases
- Contracts
- Payment terms

Fix

We introduced **closed-world grounding**:

Every deliverable must be supported by the client request or verified service data.

If information is missing, the system should say:

“Not specified in the client request.”

rather than assuming it.

Human approval remains mandatory.

Slide 7 Production Roadmap & Conclusion

Next Steps

1. Scale

- Move from CSV to production database.
- Add persistent project/client data.
- Deploy FastAPI with authentication.

2. Strengthen Guardrails

- Automated claim verification.
- More adversarial evaluation cases.
- Structured scope-risk detection.

3. Human Oversight

- Keep approval before client delivery.
- Highlight unsupported claims for reviewers.

4. Continuous Evaluation

- Maintain regression test suite.
- Re-evaluate after model, prompt, or tool changes.

Final Message

The system demonstrates a practical multi-agent architecture for freelance automation.

It already handles:

- Requirement analysis
- Scope assessment
- Proposal generation
- Validation
- Error handling
- Logging
- Human approval

The next priority is not simply making the agent more autonomous—it is making it **more reliable, grounded, observable, and safe for production use.**
